Topic: Java Web Project Deployment (Tomcat + MySQL)

1. Basic Concepts

Web Project:- Browser par run hota hai.

Apache Tomcat:- Web Server / Application Server hai, jisme project run hota hai.

MySQL:- Database Server hai (jo background me automatically run hota hai).

* **Connection Flow:**

Tomcat server database se data lene ke liye MySQL server ko request bhejta hai.

WAR File:-Iska full form :-Web Application Archive hota hai. Pura project banne ke baad deployment ke liye WAR file create karni padti hai.

2. Configuration / Database URL

Resource Path:
src/main/resources/rightarrow /com/
/rightarrow /sunilos/rightarrow/p4/
rightarrow /bundle (yahan properties ya bundle files hoti hain).

* MySQL JDBC URL Format:*
jdbc:mysql://localhost:3306/p04

(Yahan `3306` port number hai aur `p04` database ka naam hai).

3. WAR File Generate Karne Ka Step-by-Step Process (Maven Build)

Pura code complete karne ke baad Maven se build karte hain:

1. Project par Right Click karein \rightarrow\ 'Run As' select karein.

2. Maven build.... par click karein.

3. Goals me type karein: `clean install`.

4. Skip Tests checkbox ko check (tick checkmark) karein.

5. Apply par click karein aur fir 'Run' dabayein.

6. Console me BUILD SUCCESS message aane ka wait karein.

4. Project Deploy Kaise Karein

1. Build successful hone ke baad project folder ko Refresh karein.

2. Project ke andar `target` folder open karein.

3. `target` folder ke andar generated `.war` file dikhegi.

4. Us `.war` file ko 'Copy' karein.

5. Apne 'Tomcat installation folder' me jayein aur `webapps` folder ke andar use

'Paste' kar dein.

6. Tomcat server start karein; project browser par run hone ke liye ready ho jayega.
